WO 2003-GB4823 W 20031106  
AB A chewable medicated comestible is made by mixing a pharmaceutically active ingredient, water and a substrate. The substrate has confectionery and binding properties and the mixing process produces a malleable solid confection which can be divided into discrete dosed units in the form of chewable tablets. The substrate may be a particular sugar. A chewable tablet contained modified starch 50, water 7, sorbitol 8, starch 1.5, milk protein 1, gelatin 1.2, water 5, glycerol 5, propylene glycol 2, titanium dioxide 1, vegetable fat 6, omeprazole 0.25, lactose 7.05, and maltodextrin 10%.

PRIORITY APPLN. INFO.: US 2004-985709 A 20041110

AB A delivery device for oral care agent, especially a tooth whitening agent, is provided which comprises a permanently deformable waxy backing layer, an oral care layer made of a hydrophilic polymer, and a non-woven binding material with a first part that is substantially invested in the oral care layer and a second part that is substantially invested in the backing layer. The device is sized to fit over a plurality of teeth in an upper or lower dental arch of a subject. The oral care layer comprises at least one oral care agent and at least one hydrophilic polymer. When hydrated, the oral care layer has an adhesiveness relative to the surface of a user's teeth that is sufficient to retain the device on the user's teeth when placed thereon. The device can also have an oral care agent which is activated on hydration of the oral care layer, or an oral care layer which

Updated Search

10544224

releases the oral care agent over time. For example, a system for delivering a tooth whitening agent was constructed comprising (i) a backing layer (thickness of about 0.38 mm) composed of microcryst. wax 50%, paraffin wax 15% and a hydrocarbon resin (Escorez 5380) 35%, (ii) a non-woven binding layer (thickness of about 0.152 mm) composed of a layer of spun bonded polypropylene (Tytar) invested in the backing layer, and (iii) an oral care layer containing Kollidone 90 58%, Carbowax 400 30%, and Eudragit L100/55 12%. The oral care agent (an aqueous hydrogen peroxide

solution

equivalent to 3-10% of oral care layer) was absorbed by the oral care layer, Delnet nonwoven polyolefin fabric scrim was placed over the aqueous hydrogen peroxide solution printed onto the nonwoven, followed by laminating the oral care layer to the binding material. After the backing and oral care layers were formed with the binding material, devices of were cut to the desired size and shape and vacuum formed on a forming die. The overall thickness of the device was about 0.51 to 0.61 mm.

AB There is disclosed the use of triprolidine for enabling an individual to wake refreshed after sleep and the method of treating such an individual with triprolidine. The triprolidine is administered shortly before a person wishes to fall asleep, preferably orally and most commonly in the form of a tablet containing less than 5 mg, e.g. 0.1 mg, 1.25 mg or 2.5 mg, of the active ingredient. The triprolidine is also effective in enabling an individual to sleep more easily. There is also disclosed such uses of, and methods of treating with, consumable films comprising triprolidine, and triprolidine in combination with at least one further active pharmaceutical agent, and consumable films comprising triprolidine in combination with at least one further active pharmaceutical agent.

AB The present invention is directed to a vitamin additive such as Vitamin A, B12, C, D, E, incorporated into the thermoplastic material of a sock, glove or like body protection article. The thermoplastic material is preferably a block copolymer such as SEBS, SEPS and SEEPS copolymer. Addnl., the thermoplastic material can include natural oils such as grape seed oil, avocado oil, jojoba oil, canola oil, ceramides, aloe and olive oil. Such materials impart beneficial properties to the skin including reducing scar tissue from burned skin and skin healing from a surgical procedure by maintaining the skin in a moist and lubricated state.

AB A pharmaceutical composition for controlled onset and sustained release of an active ingredient, comprises: (i) a core comprising: (a) an active ingredient; (b) a hydrophilic carrier; (c) a hydrodynamic diffusion enhancer; and optionally (d) conventional excipients selected from the group consisting of binders, fillers and lubricants and combinations thereof; and (ii) a functional coating membrane surrounding the core. Thus, 240 g verapamil-HCl was sieved through a mesh sieve and blended with 150 g E50 premium HPMC. To this blend was added 270.0 g croscarmellose sodium and mixed for 15 min. This blend was granulated with PVP K-29/32 solution in iso-PrOH (30% weight/weight). The wet mass obtained in the above step was dried at 60° for 3 h. After drying, the granules were passed a

10544224

mesh sieve. The granules were then mixed with 2.5 g of Magnesium Stearate and 15 g of Stearic acid in a V blender. This granule blend was compressed in a tablet press by using appropriate size tooling. The granules were then mixed with 2.5 g of Mg stearate and 15 g of stearic acid in a V blender. This granule blend was compressed in a tablet press by using appropriate size tooling. These tablets were then coated by using a perforated coating pan. A seal coating membrane was applied on the surface of tablets to achieve a weight gain of 1.66% of the weight of the core. The seal coating dispersion of Opadry Clear in water at 10% was sprayed on to the surface of the tablets by using a perforated coating pan.

AB The invention relates to a method, a kit and a device for controlling the flux of penetrants across an adaptable semi-permeable porous barrier, the method comprising the steps of: preparing a formulation by suspending or dispersing said penetrants in a polar liquid in the form of fluid droplets surrounded by a membrane-like coating of one or several layers, said coating comprising at least two kinds of forms of amphiphilic substances with a tendency to aggregate; said penetrants being able to transport agents through the pores of said barrier or to enable agent permeation through the pores of said barrier after penetrants have entered the pores, selecting a dose amount of said penetrants to be applied on a predetd. area of said barrier to control the flux of said penetrants across said barrier, and applying the selected dose amount of said formulation containing said penetrants onto said area of said porous barrier. Highly adaptable complex droplets (ultradeformable vesicles or Transfersomes) were prepared containing soybean phosphatidylcholine, Na cholate, 3H-labeled DPPC and phosphate buffer.

OTHER SOURCE(S): MARPAT 133:94512

AB A formulation comprises mol. arrangements capable of penetrating pores in a barrier, owing to penetrant adaptability, despite the fact that the average diameter of the pores is smaller than the average penetrant diameter, provided that

the penetrants can transport agents or cause permeation through the pores after penetrants have entered pores. The formulation comprises at least 1 consistency builder in an amount that increases the formulation to maximally 5 Nm/s so that spreading over is enabled. The formulation also contains 1 antioxidant in an amount that reduces the increase of oxidation index to <100% per 6 mo and/or at least 1 microbicide in an amount that reduces the bacterial count of 1 million germs added/g of total mass of the formulation to <100 in the case of aerobic bacteria, to <10 in the case of

10544224

entero-bacteria, and to <1 in the case of Pseudomonas aeruginosa or Staphilococcus aureus, after a period of 4 days. Thus, a composition contained soybean phosphatidylcholine 347, Tween-80 623, sodium dodecyl sulfate 30, benzyl alc. 50, clobetasol 17-propionate 25 and pH 6.5 50 mM phosphate buffer 9000 mg.

AB The invention provides a pharmaceutically acceptable polymeric material formed in situ at a body surface and a process for the preparation of material. The polymeric material is formed by applying an anionic polymer and a cationic polymer to the surface in the presence of water. Thus, an anionic solution contained sodium alginate 2, and methylparaben (preservative) 0.1 g, flavors, sweeteners, and colors q.s. and water to 100 mL. A cationic solution contained chitosan chloride (Seacure CL 211) 0.4 and methylparaben (preservative) 0.1 g, flavors, sweeteners, colors q.s. and water to 100 mL. Dissolve the Me paraben, flavors, sweeteners and colors in the water. Between 0.2 and 1 mL of each solution may be sprayed simultaneously onto the back of the throat to form a soothing protective film. This film is of particular benefit to those suffering from a sore throat.

AB Salts of strongly basic anion exchangers (divinylbenzene-styrene copolymer quaternary ammonium derivs.) with diclofenac (I) are useful as anti-inflammatory agents and analgesics showing quick-slow release effects. Thus, 100 g cholestyramine resin (Duolite 143, particle size 80  $\mu$ ) was stirred with 500 mL 2N NaOH at 50° for 4 h, decanted, washed, stirred with 500 mL 2N HCl at 50° for 4 h, decanted, washed, left in iso-PrOH for 2 h, filtered, washed, and dried at 50° in vacuo. This resin (100 g) was added slowly to 100 g I Na salt in 5 L H<sub>2</sub>O, stirred at 50° for 12 h, filtered, and dried at 50° in vacuo. The product was formulated in tablets, capsules, and suppositories.

AB A delivery device for oral care agent, especially a tooth whitening agent, is provided which comprises a permanently deformable waxy backing layer, an oral care layer made of a hydrophilic polymer, and a non-woven binding material with a first part that is substantially invested in the oral care layer and a second part that is substantially invested in the backing layer. The device is sized to fit over a plurality of teeth in an upper or lower dental arch of a subject. The oral care layer comprises at least one oral care agent and at least one hydrophilic polymer. When hydrated, the oral care layer has an adhesiveness relative to the surface of a user's teeth that is sufficient to retain the device on the user's teeth when placed thereon. The device can also have an oral care agent which is activated on hydration of the oral care layer, or an oral care layer which releases the oral care agent over time. For example, a system for delivering a tooth whitening agent was constructed comprising (i) a backing layer (thickness of about 0.38 mm) composed of microcryst. wax 50%, paraffin wax 15% and a hydrocarbon resin (Escorez 5380) 35%, (ii) a non-woven binding layer (thickness of about 0.152 mm) composed of a layer of spun bonded polypropylene (Tyvar) invested in the backing layer, and (iii) an oral care layer containing Kollidone 90 58%, Carbowax 400 30%, and Eudragit L100/55 12%. The oral care agent (an aqueous hydrogen peroxide solution

equivalent to 3-10% of oral care layer) was absorbed by the oral care layer, Delnet nonwoven polyolefin fabric scrim was placed over the aqueous hydrogen peroxide solution printed onto the nonwoven, followed by laminating the oral care layer to the binding material. After the backing and oral care layers were formed with the binding material, devices of were cut to the desired size and shape and vacuum formed on a forming die. The overall thickness of the device was about 0.51 to 0.61 mm.

AB The present invention is directed to compns. of one or more  
nanoparticulate active agents, at least one PEG-derivatized surface  
stabilizer, and at least one antibody or fragment thereof, and methods of  
using such compns. for targeting delivery of the one or more active agents  
to a desired site. The one or more active agents preferably have a  
particle size of  $\leq 2 \mu$ . The targeted delivery can be used, e.g.,  
for disease diagnosis, imaging, or drug delivery. Thud, WIN-68209  
particles wee stabilized by PEG-DSPE stabilizer.

AB Hydrophobic organic salts can be determined by pseudo-single-phase  
ion-par titration in an oil-in-water emulsion stabilized with a nonionic  
surfactant. Conditions were proposed for determining anionic and cationic  
surfactants and some hydrophobic salt pharmaceuticals in an  
emulsion stabilized with Triton X-305 using molybdenum(VI)-pyrogallol  
(bromopyrogallol) red complexes for the detection of the titration end-point.

AB The present invention is directed to a vitamin additive such as Vitamin A, B12, C, D, E, incorporated into the thermoplastic material of a sock, glove or like body protection article. The thermoplastic material is preferably a block copolymer such as SEBS, SEPS and SEEPS copolymer. Addnl., the thermoplastic material can include natural oils such as grape seed oil, avocado oil, jojoba oil, canola oil, ceramides, aloe and olive oil. Such materials impart beneficial properties to the skin including reducing scar tissue from burned skin and skin healing from a surgical procedure by maintaining the skin in a moist and lubricated state.

AB The present invention relates to a process for preparing tablet dosage forms of poorly-compressible pharmaceuticals and to tablet dosage forms. The process is especially useful for preparing tablets of the poorly-compressible drug metformin-HCl. Thus, tablets contained metformin-HCl 500, HPMC 320, stearyl alc. 200, and Mg stearate mg/unit.

AB A pharmaceutical composition for controlled onset and sustained release of an active ingredient, comprises: (i) a core comprising: (a) an active ingredient; (b) a hydrophilic carrier; (c) a hydrodynamic diffusion enhancer; and optionally (d) conventional excipients selected from the group consisting of binders, fillers and lubricants and combinations thereof; and (ii) a functional coating membrane surrounding the core. Thus, 240 g verapamil-HCl was sieved through a mesh sieve and blended with 150 g E50 premium HPMC. To this blend was added 270.0 g croscarmellose sodium and mixed for 15 min. This blend was granulated with PVP K-29/32 solution in iso-PrOH (30% weight/weight). The wet mass obtained in the above

step

was dried at 60° for 3 h. After drying, the granules were passed a mesh sieve. The granules were then mixed with 2.5 g of Magnesium Stearate and 15 g of Stearic acid in a V blender. This granule blend was compressed in a tablet press by using appropriate size tooling. The granules were then mixed with 2.5 g of Mg stearate and 15 g of stearic acid in a V blender. This granule blend was compressed in a tablet press by using appropriate size tooling. These tablets were then coated by using a perforated coating pan. A seal coating membrane was applied on the surface of tablets to achieve a weight gain of 1.66% of the weight of the core. The seal coating dispersion of Opadry Clear in water at 10% was sprayed on to the surface of the tablets by using a perforated coating pan.

AB An oral composition based on hyaluronic acid or its salts and optionally a therapeutic drug is provided for treating or preventing osteoarthritis, joint effusion, joint inflammation and pain, synovitis, lameness, post-operative arthroscopic surgery, deterioration of proper joint function including joint mobility, the reduction or inhibition of metabolic activity of chondrocytes, the activity of enzymes that degrade cartilage, and the reduction or inhibition of the production of hyaluronic acid in a mammal. Addnl., compns. containing hyaluronic acid, chondroitin sulfate and glucosamine sulfate in a paste formulation are also described which can be administered on their own or can be used as a feed additive for cats and dogs. For example, a composition contained (by weight) glucosamine sulfate

36%, chondroitin sulfate 4%, sodium hyaluronate 0.144%, manganese sulfate 0.144%, ibuprofen 200 mg, powdered sugar 20%, glycerin 0.7%, xanthan gum 0.2%, sodium benzoate 0.7%, citric acid 0.2%, molasses 23.5%, and water 14.4%.

AB The invention relates to a method, a kit and a device for controlling the flux of penetrants across an adaptable semi-permeable porous barrier, the method comprising the steps of: preparing a formulation by suspending or dispersing said penetrants in a polar liquid in the form of fluid droplets surrounded by a membrane-like coating of one or several layers, said coating comprising at least two kinds of forms of amphiphilic substances with a tendency to aggregate; said penetrants being able to transport agents through the pores of said barrier or to enable agent permeation through the pores of said barrier after penetrants have entered the pores, selecting a dose amount of said penetrants to be applied on a predetd. area of said barrier to control the flux of said penetrants across said barrier, and applying the selected dose amount of said formulation containing said penetrants onto said area of said porous barrier. Highly adaptable complex droplets (ultradeformable vesicles or Transfersomes) were prepared containing soybean phosphatidylcholine, Na cholate, 3H-labeled DPPC and phosphate buffer.

AB A formulation comprises mol. arrangements capable of penetrating pores in a barrier, owing to penetrant adaptability, despite the fact that the average diameter of the pores is smaller than the average penetrant diameter, provided that

the penetrants can transport agents or cause permeation through the pores after penetrants have entered pores. The formulation comprises at least 1 consistency builder in an amount that increases the formulation to maximally 5 Nm/s so that spreading over is enabled. The formulation also contains 1 antioxidant in an amount that reduces the increase of oxidation index to <100% per 6 mo and/or at least 1 microbicide in an amount that reduces the bacterial count of 1 million germs added/g of total mass of the formulation to <100 in the case of aerobic bacteria, to <10 in the case of entero-bacteria, and to <1 in the case of Pseudomonas aeruginosa or Staphilococcus aureus, after a period of 4 days. Thus, a composition contained soybean phosphatidylcholine 347, Tween-80 623, sodium dodecyl sulfate 30, benzyl alc. 50, clobetasol 17-propionate 25 and pH 6.5 50 mM phosphate buffer 9000 mg.

AB A composition for controlled delivery of a biol. active substance for medical or agricultural use includes (a) a nonpolymeric, non-water-soluble liquid carrier material of viscosity  $\geq 5000$  cP at  $37^\circ$  that does not crystallize neat under ambient or physiol. conditions and, optionally, (b) an active substance to be delivered. Prior to application, the high-viscosity carrier (which is preferably biodegradable) is mixed with a viscosity-lowering water-soluble or -miscible solvent to form a lower-viscosity liquid carrier which is mixed with the active substance; on application into the body or on a surface, the solvent dissipates or diffuses away, forming in situ a highly viscous implant or composition that

10544224

releases the active substance over time. The composition may be combined with a 2nd carrier to form an emulsion, gel, or transdermal delivery system. Thus, a composition containing diclofenac Na 2.5, sucrose acetate isobutyrate (high-viscosity carrier) 88, sucrose 2.5, and EtOH 7 weight% released diclofenac into phosphate-buffered saline at 37° to the extent of .apprx.37, 46, and 50% after 1, 24, and 72 h, resp.

IT 15307-79-6, Diclofenac sodium

AB The invention provides a pharmaceutically acceptable polymeric material formed in situ at a body surface and a process for the preparation of material. The polymeric material is formed by applying an anionic polymer and a cationic polymer to the surface in the presence of water. Thus, an anionic solution contained sodium alginate 2, and methylparaben (preservative) 0.1 g, flavors, sweeteners, and colors q.s. and water to 100 mL. A cationic solution contained chitosan chloride (Seacure CL 211) 0.4 and methylparaben (preservative) 0.1 g, flavors, sweeteners, colors q.s. and water to 100 mL. Dissolve the Me paraben, flavors, sweeteners and colors in the water. Between 0.2 and 1 mL of each solution may be sprayed simultaneously onto the back of the throat to form a soothing protective film. This film is of particular benefit to those suffering from a sore throat.

AB Nanoemulsion compns. with low toxicity that demonstrate broad spectrum inactivation of microorganisms or prevention of diseases are described. The nanoemulsions contain an aqueous phase, an oil phase comprising an oil and an organic solvent, at least one anti-inflammatory agent, and one or more surfactants. Methods of making nanoemulsions and inactivating pathogenic microorganisms are also provided. Thus, a nanoemulsion contained EDTA 25, and cetylpyridinium chloride 25 g, EtOH 200, Tween-20 125, soybean oil 1600, and water 548 mL.

AB A chewable medicated comestible is made by mixing a pharmaceutically active ingredient, water and a substrate. The substrate has confectionery and binding properties and the mixing process produces a malleable solid confection which can be divided into discrete dosed units in the form of chewable tablets. The substrate may be a particular sugar. A chewable tablet contained modified starch 50, water 7, sorbitol 8, starch 1.5, milk protein 1, gelatin 1.2, water 5, glycerol 5, propylene glycol 2, titanium dioxide 1, vegetable fat 6, omeprazole 0.25, lactose 7.05, and maltodextrin 10%.

AB This invention relates to preparing agent for treatment of allergic rhinitis and allergic conjunctivitis. Agent comprises a base and cytokines taken among the group: recombinant alpha-, beta-, gamma-interferon taken in the amount 1000-100,000 IU/g of agent; antihistaminic preps. taken among the group: diazolin, mebhydrolin, antazoline, ebastin, loratadine, levocabastine, azelastine, astemizole, terfenadine, diphenhydramine, chloropyramine, cetirizine, promethazine taken in the amount 0.0001-0.1 g/g of agent; corticosteroid preps. taken among the group: hydrocortisone, fludrocortisone, flumetasone, betamethasone, mometasone, fluorocortolone, triamcinolone, prednisone, prednisolone, dexamethasone taken in the amount 0.002-0.01 g/g of agent. Agent comprises addnl. anti-inflammatory preps. taken among the group: sodium diclofenac, indometacin, ibuprofen, naproxen; antibacterial agent taken among the group: dioxydine, zinc sulfate, myramistin; antibiotics with broad spectrum of effect, methylbenzethonium chloride, cetylpyridinium chloride, alkyltrimethylammonium bromide, chlorhexidine gluconate, iodopovidone, imidazolidinyl urea, diazolidinyl urea. Agent comprises also addnl. regulators and stabilizers of cellular functions taken among the group: theophylline, sodium cromoglycate, sodium nedocrimal, vitamins and it comprises also vasoconstrictive preps. taken among the group: xylometazoline, naphazoline, oxymetazoline, tetrazyline, phenylephrine. As a base the agent comprises one or some components taken among the group of addns. including: vaseline, glycerol, polyethylene oxide, propylene glycol, vegetable oil, essential oil, silicone oil. Invention provides the development of highly effective agent for treatment of allergic rhinitis and allergic conjunctivitis. The invention showed improved preparation method, enhanced effectiveness and valuable medicinal properties of

AB The present invention relates to a layered pharmaceutical delivery device for the administration of pharmaceuticals or other active compds. to mucosal surfaces. The device may also be used by itself without the incorporation of a therapeutic. The device of the present invention consists of a water-soluble adhesive layer, a non-adhesive, bioerodible backing layer and one or more pharmaceuticals if desired in either or both layers. Upon application, the device adheres to the mucosal surface, providing protection to the treatment site and localized drug delivery. The "Residence Time", the length of time the device remains on the mucosal surface before complete erosion, can be easily regulated by modifications of the backing layer.

AB This invention relates to controlled release and taste masking comps. containing one or more active principles incorporated in a three-component matrix structure, i.e. a structure formed by amphiphilic, lipophilic or inert matrixes and finally incorporated or dispersed in hydrophilic matrixes. The use of a plurality of systems for the control of the dissoln. of the active ingredient modulates the dissoln. rate of the active ingredient in aqueous and/or biol. fluids, thereby controlling the release kinetics in the gastrointestinal tract. For example, a taste-masked buccal tablet contained ibuprofen 100, cetyl alc. (lipophilic/inert matrix) 15, soy lecithin (amphiphilic matrix) 8, mannitol (hydrophilic matrix) 167, maltodextrin 150, hydroxypropyl Me cellulose 30, aspartame 15, flavors 5, colloidal silica 5, and Mg stearate 5 mg.

IT 15307-79-6, Diclofenac sodium 15307-86-5, Diclofenac  
RL: THU (Therapeutic use); BIOL (Biological study); USES (Uses)  
(multiple matrix system for controlled-release and taste-masking oral comps.)

AB This invention relates to an oral unit dosage comprising a substrate defining a plurality of discrete reservoirs each containing a liquid fill for release in the mouth. Each oral unit dosage comprised a single piece of gelatin defining twelve reservoirs each having a liquid fill (0.1 mL) containing				
CaCO <sub>3</sub> 500, NaHCO <sub>3</sub> 100, fractionated coconut oil 600, lecithin 12, colloidal silica 34, sorbitan fatty esters 34, polysorbate-80 20, and flavors/colors/sweeteners 80 mg per capsule. The resultant chewable capsules delivered an antacid material to the throat and esophagus without the chalky characteristics normally associated with conventional antacid tablets.

AB Disclosed are sustained release medicinal compns. of medicinally active ionic substances containing ionic compds. which are charged oppositely to the medicinally active ionic substances (excluding ionic prostanoid acid derivs.) and capable of elevating the hydrophobicity of the above substances. More particularly speaking, the above-mentioned ionic compds. are those each having a hydrophobic group in its mol. These medicinal compns. can exert excellent and long-lasting effects regardless of the water-solubility of the medicinally active ionic substances. A gel contained diclofenac sodium 0.1, benzalkonium chlorides 0.36, HPC-M 10, and water 89.54 %.

AB Personal care and hygiene formulations for topical application to mucosal surfaces. These formulations include an amphiphilic lipid carrier in the form of a colloidal composition which can include a micellar aggregate or mixed micelles dispersed in a continuous aqueous phase, or an emulsion of lipid droplets suspended in a continuous aqueous phase, and an active agent which is an anti-microbial agent. The lipid carrier has high adhesiveness to mucous membranes such as the soft tissues of the oral cavity. The lipid carrier also has a high load capacity for the active agent to be carried to these tissues. These formulations have the desirable properties of carrying a large amount of active agent for controlled and prolonged release thereof at the desired site, such as mucous membrane surfaces and surrounding tissue. Accordingly, the present invention provides a formulation for oral or topical application including an anti-microbial agent and a lipid. The agent is held by the carrier through a hydrophobic interaction and is released from the carrier in a controlled manner over a prolonged period of time. The lipid is also characterized by having a high adhesive capability towards mucous membrane surfaces. The lipid and the agent are preferably present in a ratio in a range of from about 1:10 to about 10:1, more preferably from about 1:5 to about 5:1, and most preferably from about 1:3 to about 3:1 in the formulation. A mouthwash was formulated from egg lecithin (E-80) 7.5, chlorhexidine diacetate 0.625, Tween-80 0.525, D,L-menthol 0.25,  $\alpha$ -tocopherol 0.03, glycerol 10 g, EtOH 20, propylene glycol 10, and water 480 mL.

AB Biodegradable controlled-release delivery systems using melt-spun biodegradable polymers as carriers for bio-effecting agents such as pharmaceutical actives are disclosed. Oral dose forms as well as implants are described. For example, polyglycolide was melt-spun in combination with various drugs such as vancomycin, gentamicin, tolmetin, diphenhydramine, ibuprofen, and insulin and controlled drug release was demonstrated.

AB The cetylpyridinium chloride (CPC) which contains an aromatic ring and a hydrophobic cetyl group differs in its structure from the generally used cationic counter ions. Thirteen of antiphlogistic acids and their derivs. were investigated. Silica as a stationary phase and an eluent containing CPC were used. The conclusion can be drawn that CPC functions as an ion pairing agent and its use in the aqueous eluent results in the formation of a dynamically modified silica surface. The adsorption isotherm for CPC on the bare silica also was determined. Comparative data are shown on the retention of several antiphlogistic acids with CPC and cetrimide containing aqueous eluents.
